SECURITY . VISIBILITY . COMPLIANCE

Managed Information Security Provider

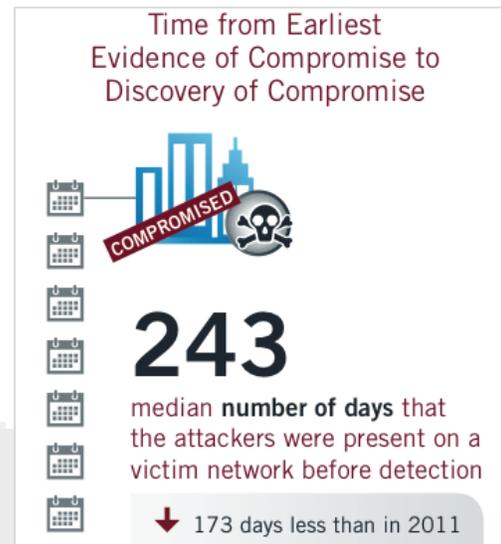

Why Choose an MSSP?

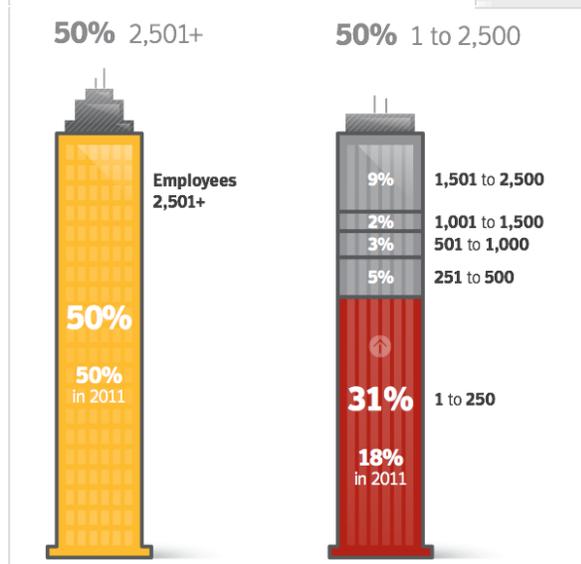

Managed Information Security Service Provider

Keep Things That are Important to Your Business Safe

Information security has become a necessary requirement for all businesses today. The growing number of security threats, their complexity and the increased mobility of data are all contributing to the difficulty of securing information today. An MSSP's primary focus is to specialize in and leverage the latest security technology to ensure that your business is always protected - reducing the cost and difficulty of managing it yourself.

Attacks by Size of Targeted Organization

Symantec Internet Security Threat Report 2013 (April 2013)

Small-Medium Sized Businesses and Mid-Market Enterprises are Now the Target

Small-medium sized businesses and mid-market enterprises are increasingly becoming the target of information security attacks and you need to be prepared. Large corporations are making significant investments to better protect themselves, making them less vulnerable to hackers. SMB's typically lack the budget and internal resources to provide strong information security capabilities, making them an easy target for these cyber criminals.

Cost Savings

MSSP's have the benefit of being able to leverage economies of scale and scope, to provide advanced management and consultation services across many customers. This allows them to provide these services for a fraction of what it would cost to bring these capabilities inside. Companies can see a significant cost savings by outsourcing these technologies; most will also benefit by not increasing headcount and by receiving additional tax advantages.

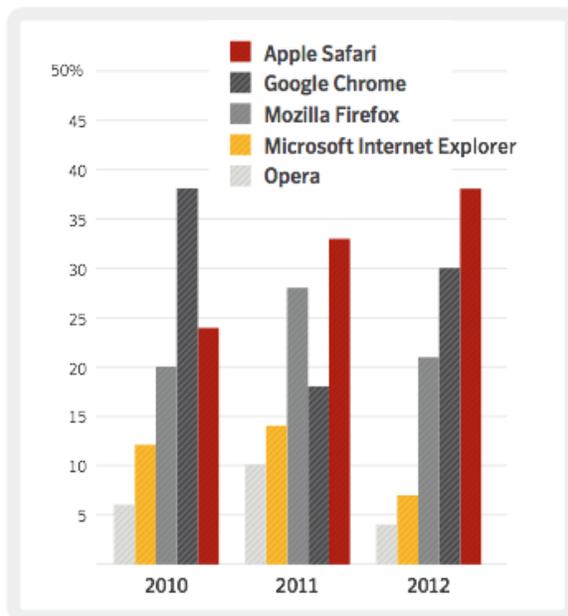

Risk Reduction

MSSP's can help you reduce the chances of a security breach and possible data loss. *You don't want your company to be the next headline.* Help protect your brand reputation and give your employees and customer's peace of mind; knowing that you are taking the right steps to protect their information and yours.

Everyday Tools of Business the Most Vulnerable

Increase Productivity

Security issues cost your business and staff time, money and resources. Get visibility into your network and application usage to understand where resources and bandwidth are being wasted. See where non-compliant applications and web traffic are being used, so they can be proactively blocked, to speed up your access and prevent potential security breaches. See when malware or virus outbreaks happen, so they can be quickly contained, minimizing the time it takes your staff to respond to incidents.

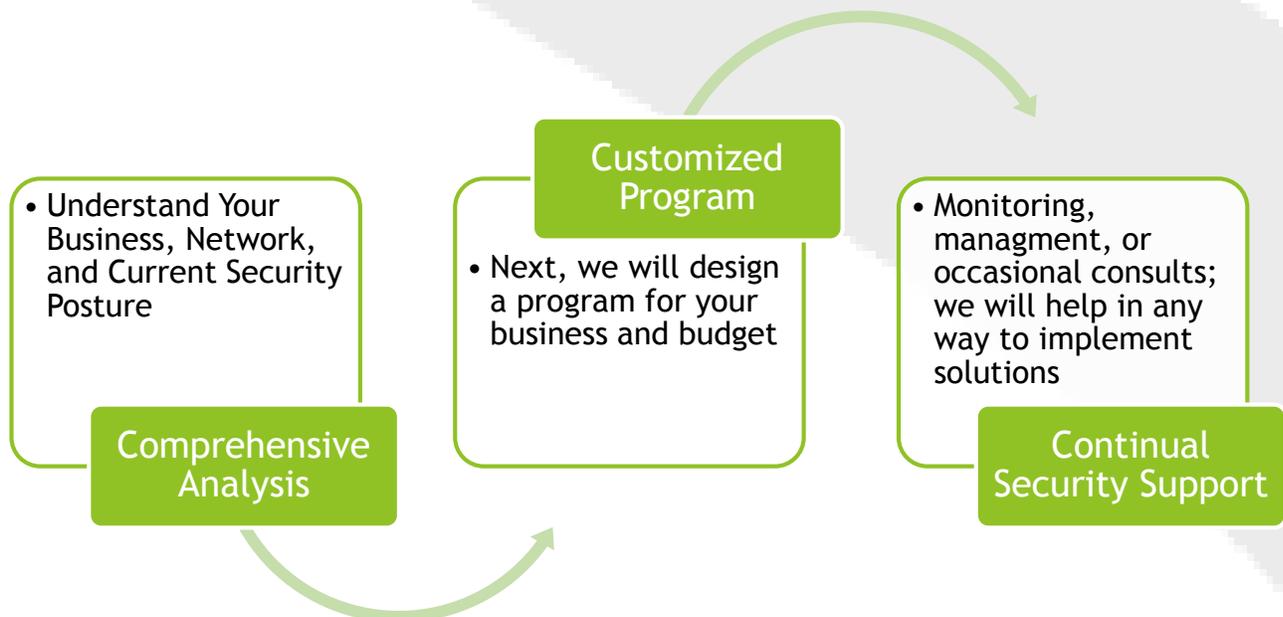

Managed Security with Sedara

Trust the Experts

Sedara provides a team of trusted experts to manage your IT security, investigate incidents and provide constructive recommendations on how to increase the overall security posture of your business. We know that there are a lot of moving parts in a business and things can change quickly. We are available to your team as a resource to help make sure your information is protected and help guide you on your path to securing your business.

Flexible Solutions

Managed Security from Sedara starts with a comprehensive analysis of your current business, network and security practices and tools. From there, we design a program that is right for your business and budget. We have several technology partners that we leverage to be able to provide the right solution to get you covered. Our capabilities allow us to be extremely flexible and implement solutions that work in any business size, location and configuration.

Sedara Security

Solutions That Fit Your Business

Managed SIEM

Sedara leverages AlienVault's Unified Security Management™ (USM) solution to provide a flexible SIEM platform that can bring event, threat, and risk information together, in a way that allows for real-time correlation and identification of unwanted behaviors. Our solution aggregates and analyzes data from many sources, providing unparalleled visibility into all activities in any environment. This capability, in conjunction with the integration of all built-in security tools, provides an all-in-one solution for security in any environment.

Intrusion Detection

Our Intrusion Detection System (IDS), integrated with USM, monitors what is going on in your environment and sends alerts when there is any suspicious activity. Because both internal and external violations can cause issues, we perform an analysis of activity patterns to determine any deviations from what is normal. Signature updates can be pushed as soon as they are released, or let us create custom signatures and alerts that are specific to your environment. We'll help you put together a game-plan and understand what the critical tasks are when an alert is received.

Security Log Management

Log collection and monitoring is paramount in today's security landscape and especially critical in many regulatory compliance programs. It gives unprecedented visibility into the activities that are taking place on your devices. Log collection is especially important when considering the additional advantage of integrating this capability with our SIEM tools, to provide correlation and an unparalleled understanding of your entire environment. Know exactly what's happened, on every device - in real time.

“ At Sedara we understand that all customers are different and we need the ability to implement solutions that are tailored to their environments, in order to provide the greatest benefit to their overall security posture.

Compliance Reporting

Manage visibility into all of your technical controls from one platform and be able to report on all activity. Compliance reporting through our USM-based solution means making your audit preparations and activities easier. Schedule reports on a recurring basis, so you always know what is going on in your environment or run them ad-hoc, only when you need them.

Managed Antivirus

How effective is your antivirus? When was the last time one of your systems got a virus? Was it cleaned effectively? If you don't know the answers to these questions, you should consider our managed antivirus solution. We'll help you deploy antivirus clients that we manage through our global cloud-based antivirus management system and take total control over your antivirus management. Our solutions can also provide enhanced endpoint protection, which protect your users against malicious websites and unauthorized data access and transmission. All the while you are getting real-time alerts for every system.

Advanced Endpoint Threat Protection and Response

Our enhanced system security solution includes advanced endpoint protection capabilities that provide application white-listing and detailed application audit trails. Put an end to unauthorized user applications and software that can leave your systems vulnerable. Only allow the applications to run that you approve and nothing else. If an intrusion, virus or malware outbreak occurs, be able to perform incident response on those systems in seconds, not days. Avoid the costly process of rebuilding systems through standard incident response procedures. Know exactly what happened, on every system, and be able to react quickly.
